Minutes of Meeting (MOM)

Meeting Title: BOCW System Discussion
Date: *(05/02/2026)*
Mode: *(Online)*
Participants: *(Aditya, Nehul, Sanjeevan Sir, Ritesh sir, HO DTNBWED, Shivalika Mishra ma'am, Nitcon)*

Agenda

To discuss system enhancements, workflow clarifications, and operational challenges related to trainer roles, assignments, approvals, APIs, and attendance functionality in the BOCW application.

Discussion Points

1. It was discussed that a **trainer can be assigned multiple job roles**, and the system should support this functionality seamlessly.
2. During the **assignment process**, it was agreed that the **trainer ID (TR_ID) and assigned job role** must be clearly captured and displayed.
3. The concept of **deemed approval from the backend** was discussed to reduce manual dependency and improve processing efficiency.
4. A requirement was raised for an **automatic deemed approval system within the mobile application**, aligned with backend logic.
5. It was discussed that APIs should return **names in English** to ensure consistency and clarity across the application.
6. The need to **fetch candidate photographs through API integration** was discussed to support verification and attendance processes.

Feedback / Observations

1. It was highlighted that **OTP-based login is not always feasible for workers**, due to device or connectivity limitations.

2. There are instances where the application displays **attendance failure messages due to network issues**, even when the process is attempted correctly.
3. In some cases, users face **authentication failure after uploading photos**, which impacts attendance completion.

Suggestions / Action Points

1. For trainer assignment to batch we want the following to be visible together:

- TR ID
- Trainer Name
- Job Role

2. Network handling and retry mechanisms should be improved to reduce **attendance failures caused by connectivity issues**.
3. The **photo upload and authentication flow** should be reviewed to ensure successful validation after image submission.
4. Automation of deemed approval processes should be implemented both at **backend and application levels** to minimize manual intervention.
